

Guidelines for Sensory Analysis in Food Product Development and Quality Control

Sensory analysis is not new to the food industry, but its application as a basic tool in food product development and quality control has not been given the recognition and acceptance it deserves. This, we believe, is largely due to the lack of understanding about what sensory analysis can offer in product research, development and marketing, and a fear that the discipline is too scientific to be practical. To some extent, sensory scientists have perpetuated this fear with a failure to recognize the constraints of industry in implementing sensory testing procedures. These guidelines are an attempt to redress the balance. Of course, product tasting is carried out in every food company: it may be the morning tasting session by the managing director, competitor comparisons by the marketeers, tasting by a product expert giving a quality opinion, comparison of new recipes from the product development kitchen, or on-line checking during production. Most relevant, though, is that the people responsible for the tasting session should know why the work is being done, and fully realize that if it is not done well, then the results and conclusions drawn, and their implications, are likely to be misleading. If, through the production of these guidelines, we have influenced some people sufficiently for them to re-evaluate what they are doing, and why, we believe our efforts have been worthwhile.
